

BKL SF-3 12/13/05

PATENT

In the Claims:

1. (Previously presented) A flashlight comprising:
  - a lens having a curved refracting surface defining an optical axis;
  - a first light source positioned on the optical axis;
  - a second light source spaced apart from the first light source away from the optical axis;
  - and
  - the lens defining an aperture registered with the second light source.
2. (Original) The flashlight of claim 1 wherein the lens has a central portion configured to transmit axially-emitted light from the first light source, and the lens having a peripheral portion having an internally reflective surface configured to reflect laterally-emitted light from the light source in a direction more closely aligned with the optical axis.
3. (Original) The flashlight of claim 2 wherein the aperture is defined in the peripheral portion of the lens.
4. (Original) The flashlight of claim 1 wherein the lens defines a recess receiving the first light source, and wherein the aperture is located away from the recess.
5. (Original) The flashlight of claim 4 wherein the recess has a rim positioned at a selected radial distance from the optical axis, and wherein the aperture is positioned radially beyond the selected distance.
6. (Original) The flashlight of claim 1 wherein a portion of the lens intervenes between the first and second light sources.
7. (Original) The flashlight of claim 1 wherein the first light source emits at least some light in a direction toward the second light source, and wherein a portion of the lens intercepts and internally reflects the at least some light and redirects it generally along the optical axis.
8. (Original) The flashlight of claim 1 wherein the first light source is an LED.

BKL SP-3 12/13/05

PATENT

9. (Original) The flashlight of claim 1 wherein the first and second light sources emit light of different colors.
10. (Original) The flashlight of claim 1 wherein the aperture is a cylindrical bore.
11. (Original) The flashlight of claim 1 wherein the aperture is parallel to the optical axis.
12. (Currently amended) A flashlight comprising:  
a lens having a curved refracting surface defining an optical axis;  
a first light source positioned on the optical axis;  
a second light source spaced apart from the first light source away from the optical axis;  
and  
the lens having a light-transmissive portion directly intervening between the first and second light sources.
13. (Original) The flashlight of claim 12 wherein the light-transmissive portion has a lens surface portion angled at a sufficient angle with respect to light rays emitted from the first source, such that the light rays are internally reflected at the lens surface portion.
14. (Original) The flashlight of claim 12 wherein the lens includes a transmission path for the second light source parallel to the optical axis.
15. (Original) The flashlight of claim 14 wherein the transmission path is a passage defined in the lens.
16. (Currently amended) The flashlight of claim 12 wherein the lens has a central portion configured to transmit axially-emitted light from the first light source, and wherein ~~the~~ an aperture is defined in a peripheral portion of the lens away from the central portion.
17. (Currently amended) The flashlight of claim ~~12~~ 16 wherein the lens defines a recess receiving the first light source, and wherein the aperture is located away from the recess.

BKL SP-3 12/13/05

PATENT

18. (Original) The flashlight of claim 12 wherein the first light source emits at least some light in a direction toward the second light source, and wherein a portion of the lens intercepts and internally reflects the at least some light and redirects it generally along the optical axis.
19. (Original) The flashlight of claim 12 wherein the first light source is an LED.
20. (Original) The flashlight of claim 12 wherein the first and second light sources emit light of different colors.
